Email Thread Collapse → Email Faithfulness Break

S1 → S6

Chain Diagram ON

Huxe reads only the last messages in an email thread, losing earlier context. The generator then produces a summary accurate for the final message but misrepresenting the full exchange. A user hears a confident audio summary that omits the most important prior context — including who made commitments, what was agreed, and when things will happen.

FIX STATUS

IN BACKLOG — RANK #1

Open Backlog Item →

⊕ WHY BLAST RADIUS = 3

Fixing ingestion.email.thread_collapse simultaneously resolves grounding.email_faithfulness_break and grounding.tense_collapse without additional engineering work, giving it a blast radius of 3. This is why thread collapse ranks #1 in the backlog despite a 5-day build time — the faster pronunciation lexicon fix (1-day TTL) only resolves a single leaf-node failure at Rank #3.
